Start the CCleaner > select *Registry* option on the left side and click on **“Scan for Issues”**. It will find all the errors and old entries in the system registry.

Note: In case if you remove something important from your registry files and need it later, CCleaner allows you to first make a backup of the registry. You will be prompted to backup during fixing process. It is recommended that you do it so that you can restore files from the backup if anything goes wrong.

Select **Fix selected Issues...** to delete the problems.
